A scenic view of a mountain range with a mossy tree in the foreground. The tree is on the left, with its branches covered in green moss. The background shows rolling green mountains under a clear sky.

Mapping Linkages Between Geophysical and Biological Diversity Across Space and Time in the Andes, Amazon, and Choco of Peru, Ecuador, and Colombia

Expertise

Paleoclimate, paleoecology

Remote sensing, tropical ecology

Paleoclimate, geochemistry

Climate modeling

Plant systematics/phylogeography

Tectonics

Remote sensing, tropical ecology

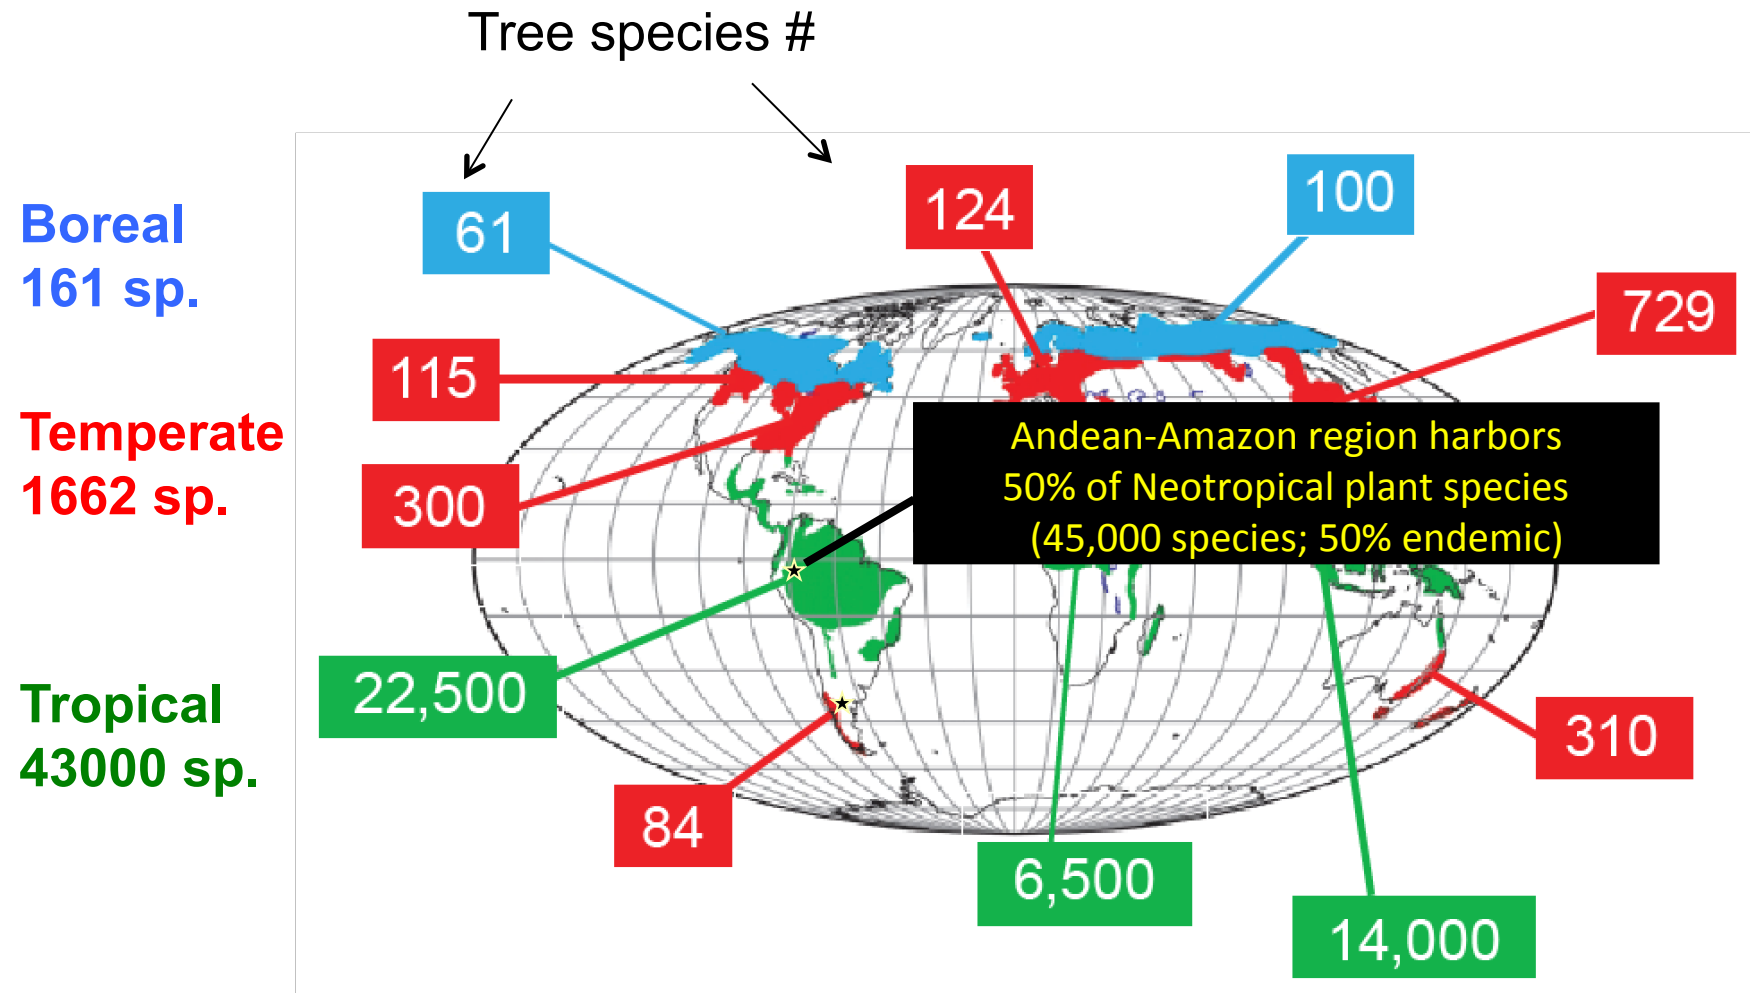

Tropical Ecology

Post-doc, Plant Systematics

PhD Student, geology

* Participated in February meeting

Global context

Estimates from Fine & Ree (2006) Am Nat 168:796

The Andean contribution to Neotropical biodiversity

65-10 Ma

10 Ma - present

Uplifting Northern Andes created Pebas wetland and subsequently Amazon basin

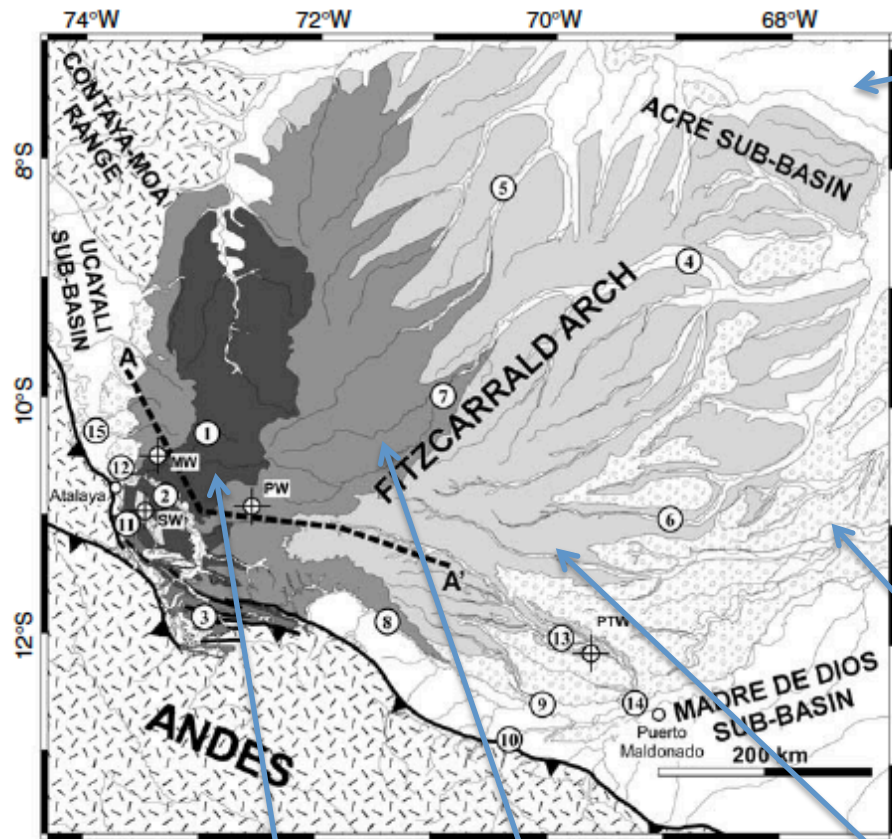

Major influence on regional precipitation, soils and hydrology

Heterogeneous, Andean-generated geological formations underlie Amazon forests.

Yet we know little of their impacts on the generation and maintenance of biodiversity

Figure from Hoorn et al. 2010 *Science*

Geological setting for biotic diversification

Pleistocene

Geological formations differ in deposition history and fertility

not widely studied as a factor in speciation

Pliocene (3-4 Ma)

Late Miocene ~ 9 Ma

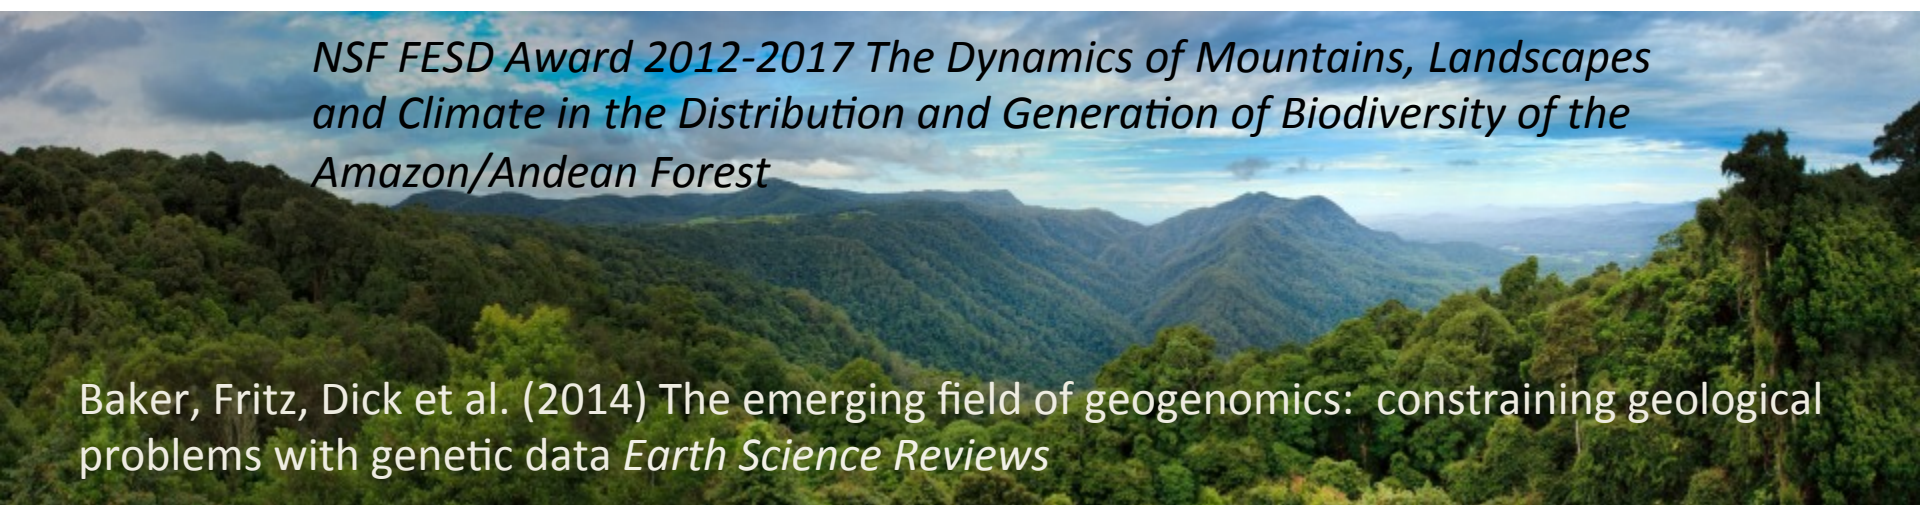

Mid Miocene >13 Ma

Mid Miocene ~13 Ma

NASA workshop builds upon NSF FESD **GeoGenomics** project

- Late Cenozoic history of Amazon river formation
- Andean uplift history and impacts on climate/landscape/diversity

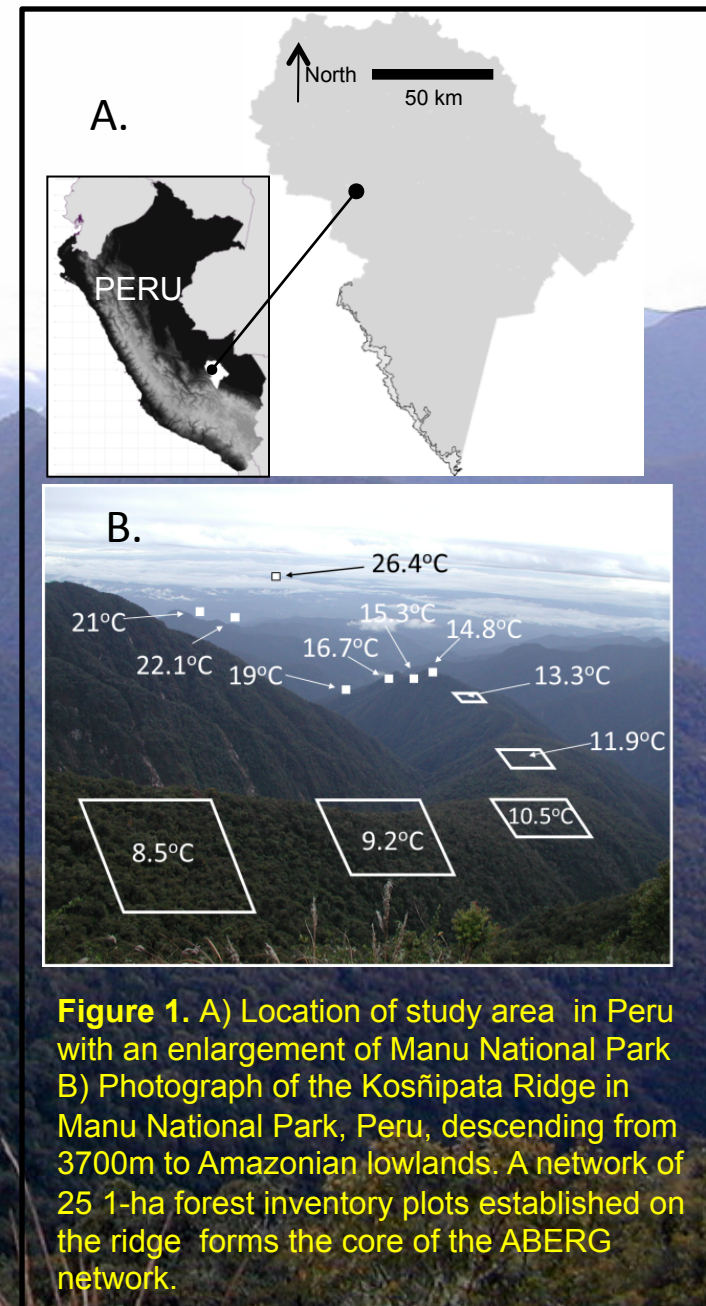

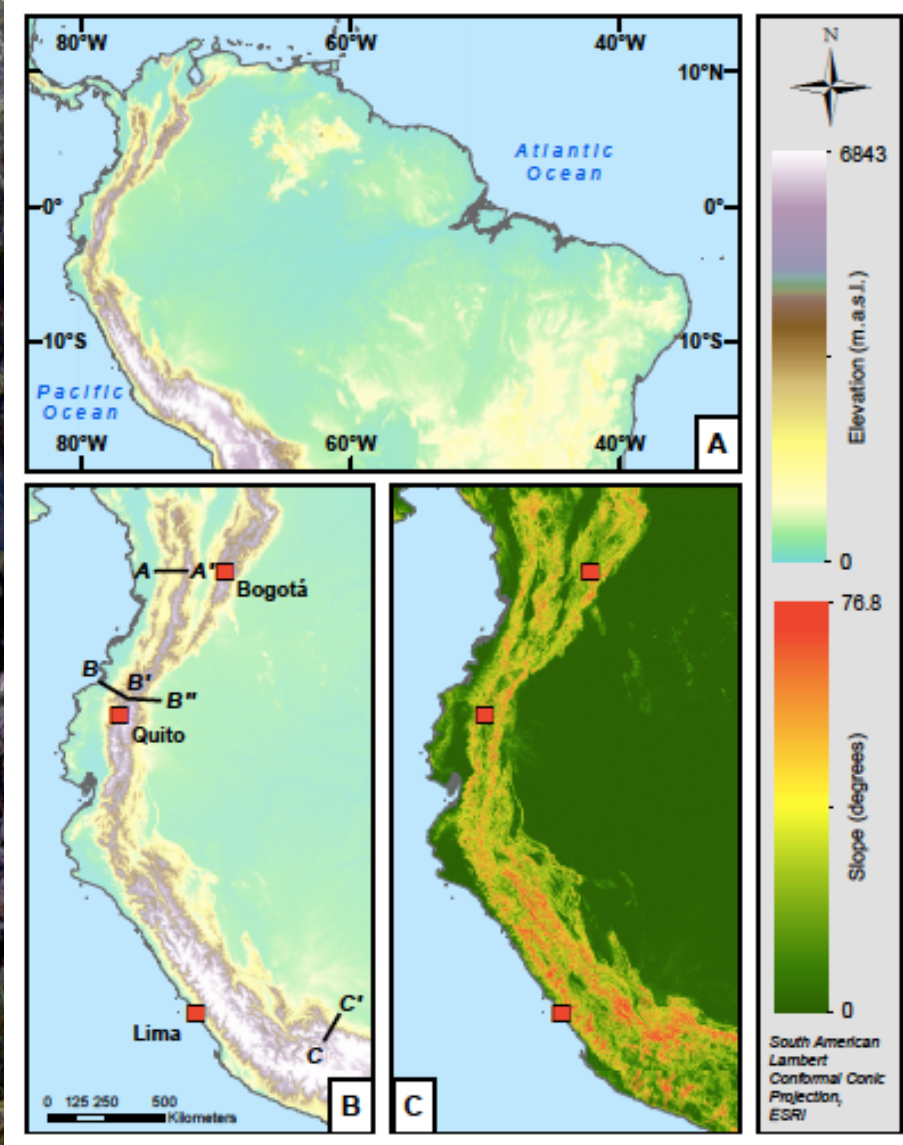

At NASA workshop: what can we learn by integrating Remote sensing, forest inventory and plant molecular genetics?

*NSF FESD Award 2012-2017 The Dynamics of Mountains, Landscapes
and Climate in the Distribution and Generation of Biodiversity of the
Amazon/Andean Forest*

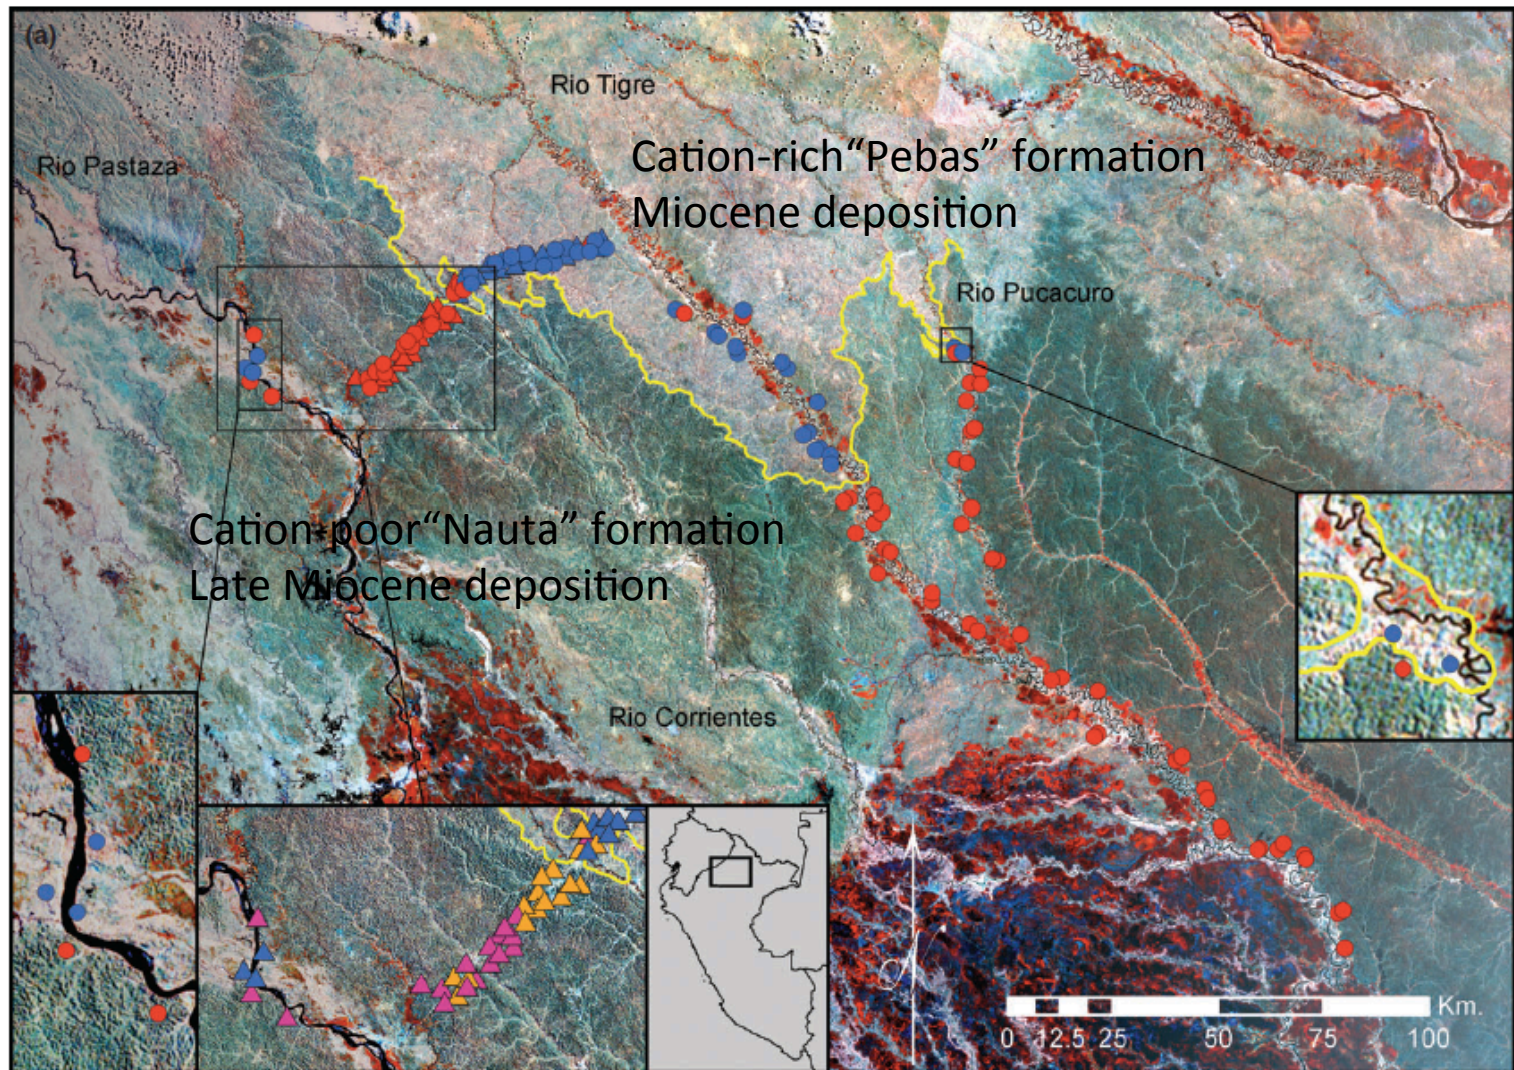

Baker, Fritz, Dick et al. (2014) The emerging field of geogenomics: constraining geological problems with genetic data *Earth Science Reviews*

Proposed Amazon-Andes forest transects

Miles Silman, photo credit

Landsat reveal geological substrates and vegetation

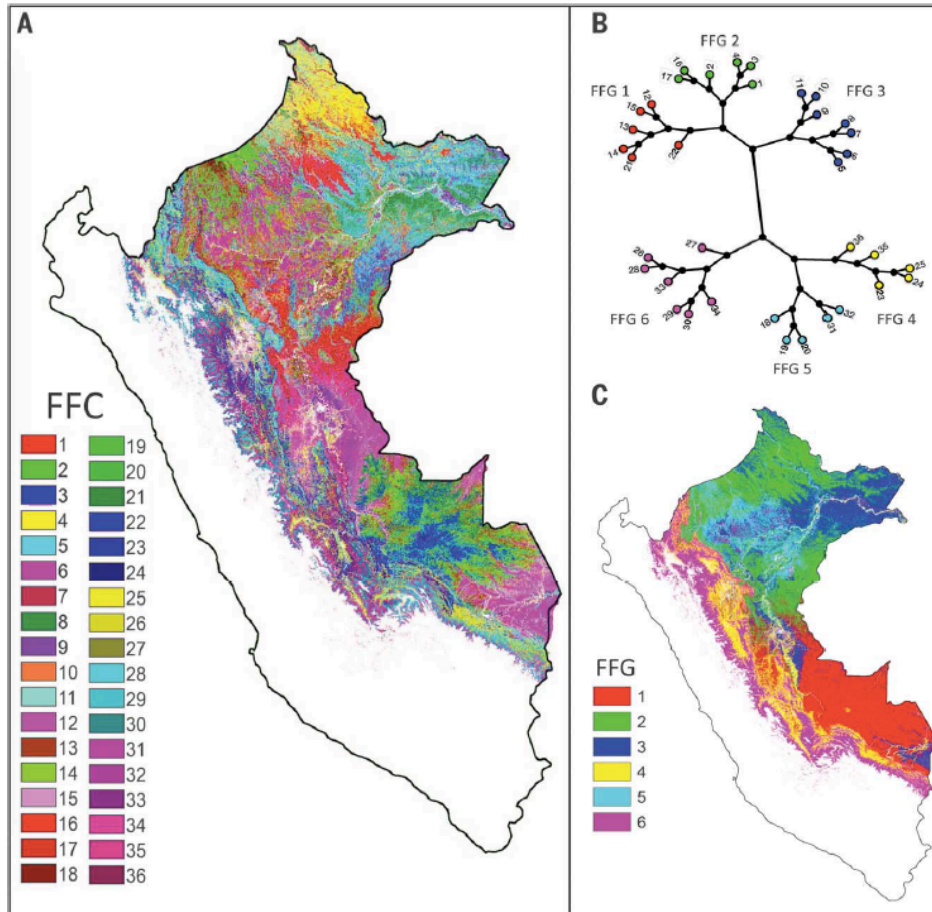

Higgins et al. (2011) J. Biogeography 38, 2136–2149

Floristic inventories show striking species turnover across geological units (shrub family Melastomataceae and ferns)

Higgins et al. (2011) *J. Biogeography* 38, 2136–2149

Functional trait biogeography

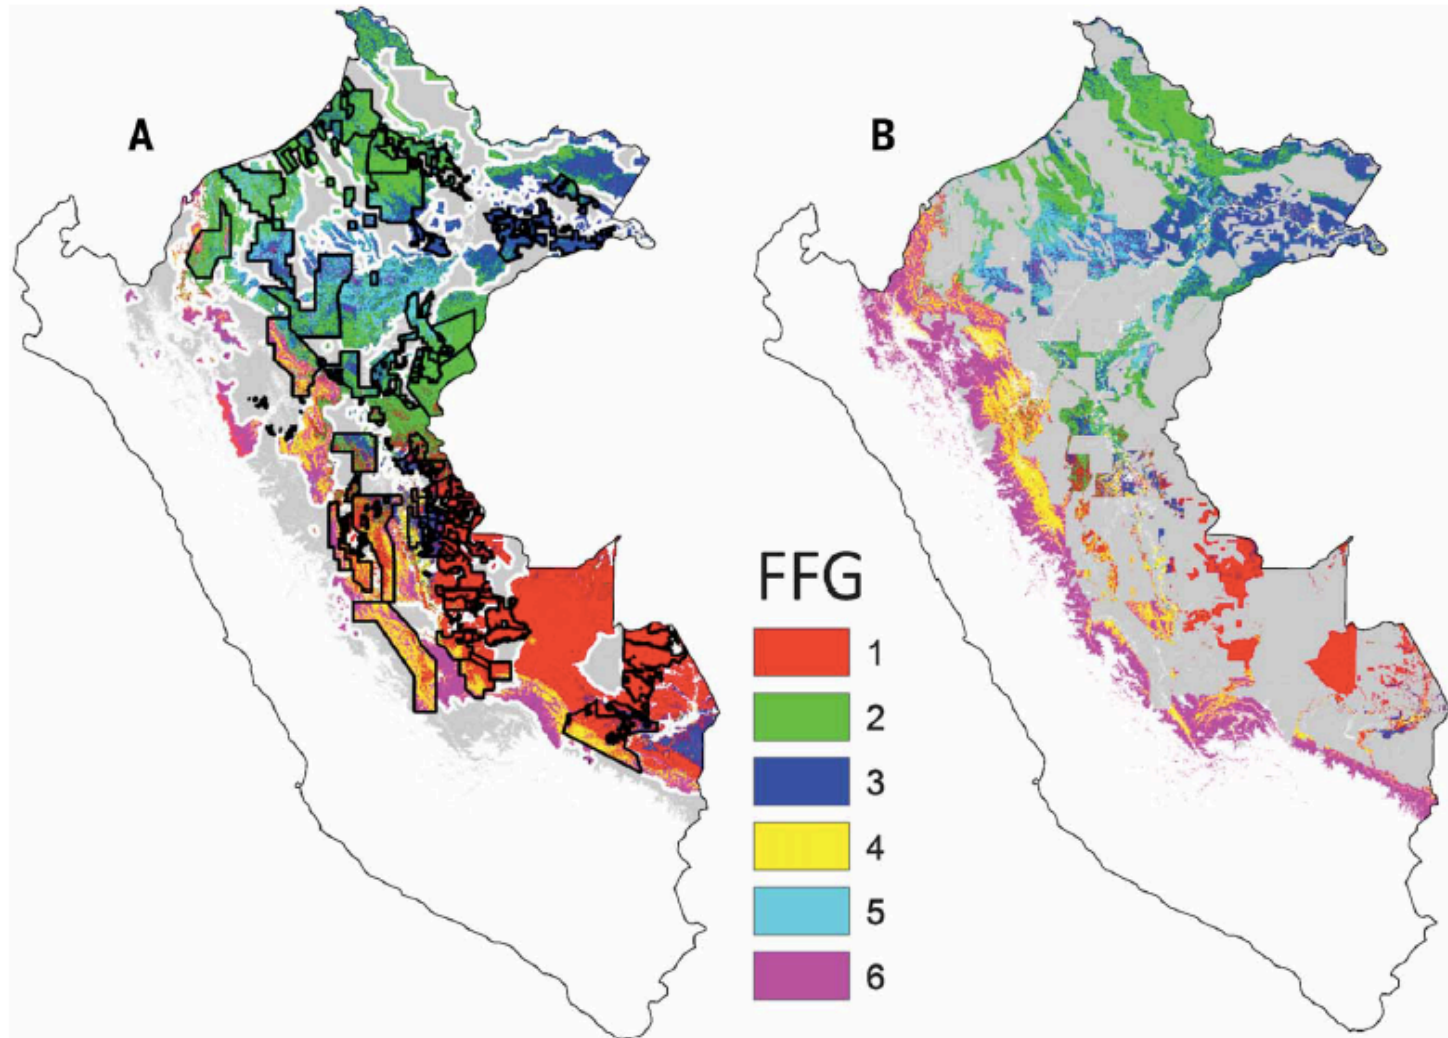

Airborne laser-guided imaging spectroscopy to map forest trait diversity and guide conservation

G. P. Asner,^{1*} R. E. Martin,¹ D. E. Knapp,¹ R. Tupayachi,¹ C. B. Anderson,¹ F. Sinca,¹ N. R. Vaughn,¹ W. Llactayo²

Geospatial variation in 7 canopy traits was explained by variation in geology, hydrology, topography and climate

Discrimination of forest types across Andean-Amazon region of Peruvian

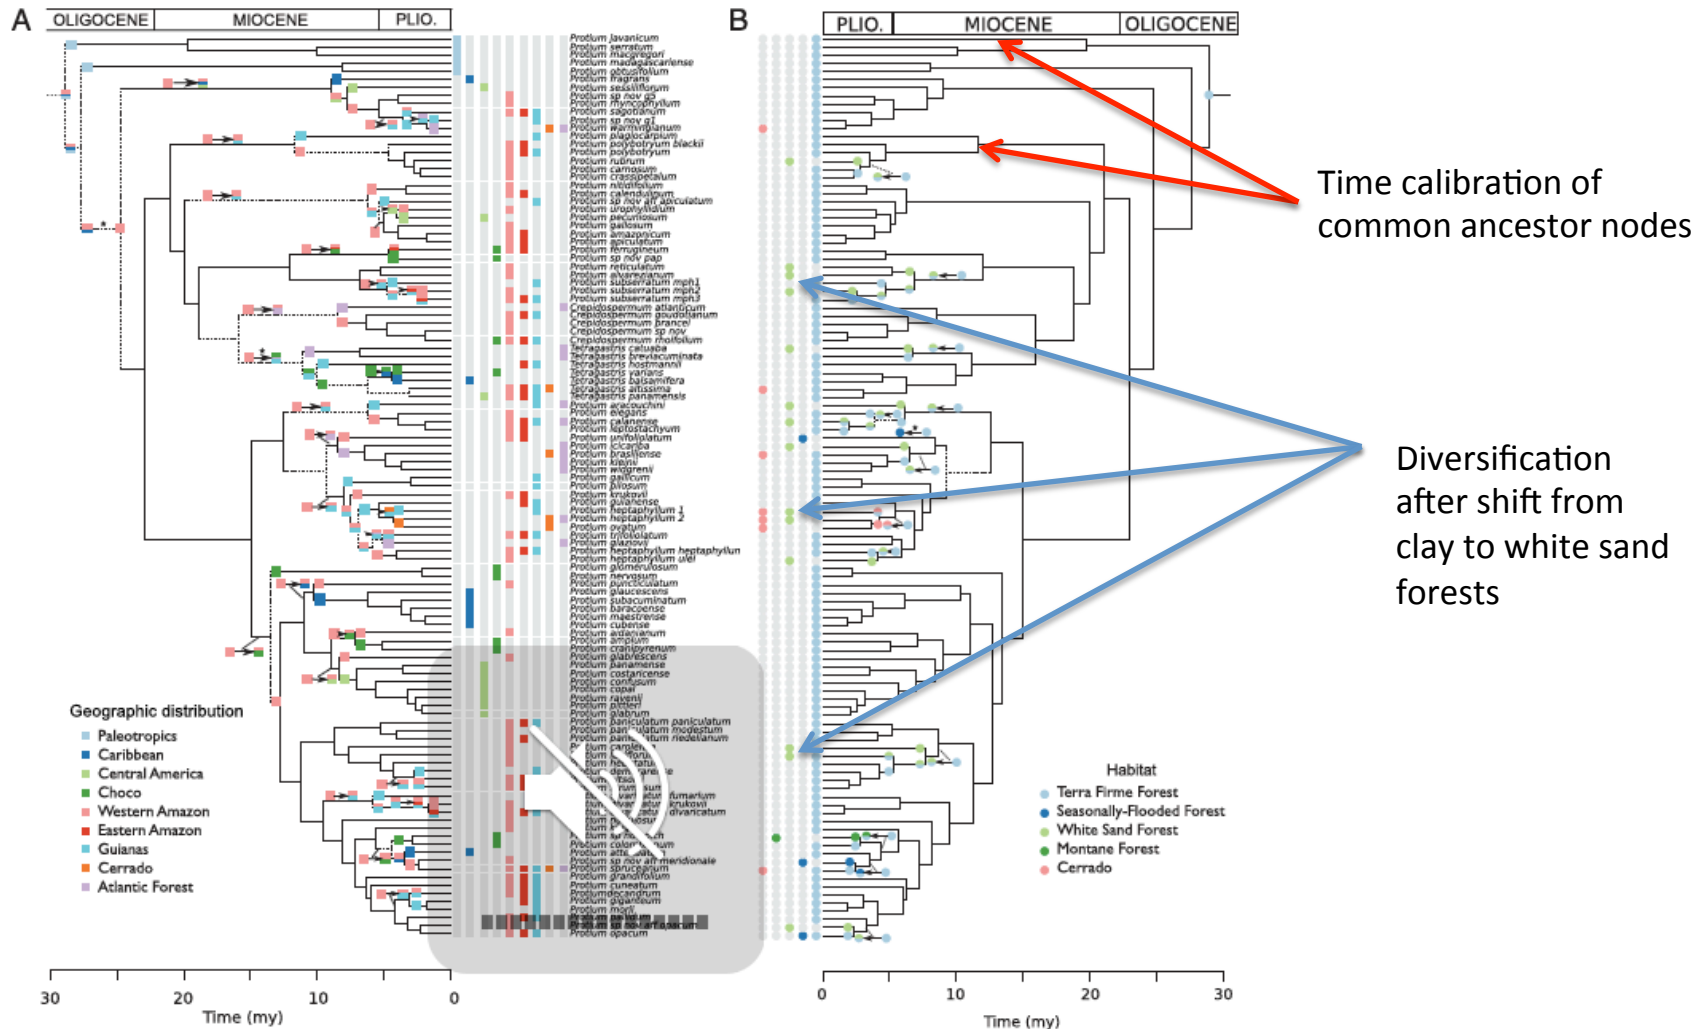

LIDAR-based designation of forest types and conservation status

Geophysical & vegetation mapping through time and space

- LIDAR Permits mapping of forest types based on plant functional traits (that have spectral signature)
- Forest types cluster with environmental features, permitting geophysical mapping
- Role in plant diversification can be inferred from phylogenetic analyses of associated clades

Habitat/Geographic mapping to phylogenies help to understand drivers of speciation

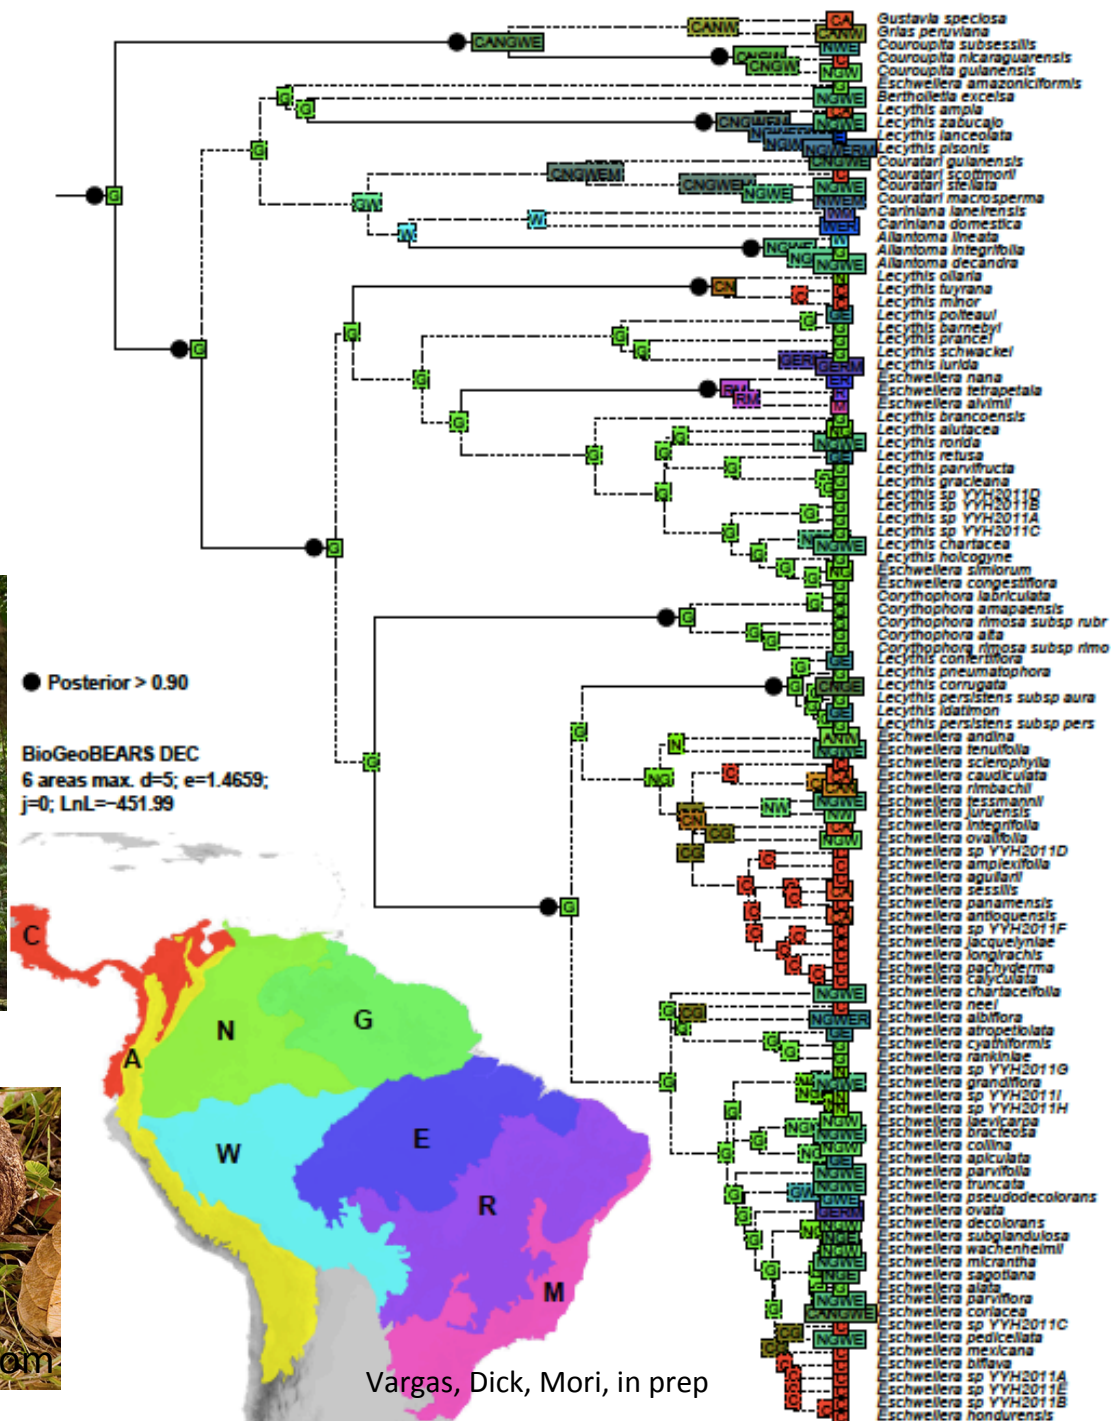

Example from Protieae clade (Burseraceae) Fine et al (2014)

Focal clades

Brazil-nut family Lecythidaceae

Brazil nut tree & Brazil nut seeds

Big questions

- How many forest types can be found within the Amazon-Amazon and Andean-Chocó regions?
- Does the heterogeneity of geological formations drive lowland biotic diversification?
- Can understanding of these processes help guide conservation efforts?

Thank you
